Building at the Intersection of Finance, Strategy, Technology, and Leadership

My professional journey has been shaped by a consistent interest in how businesses create value, how financial and strategic decisions influence that value, and how technology can translate decisions into scalable outcomes. With an engineering foundation, graduate training in engineering management, experience across banking, financial and operational analysis, enterprise systems, product and project leadership, and a full-time MBA at Santa Clara University's Leavey School of Business, I have developed a multidisciplinary perspective that connects quantitative analysis with strategic execution.

I do not view finance, technology, operations, and management as separate disciplines. Financial decisions increasingly depend on data and technology; technology investments must demonstrate economic value; strategy requires analytical judgment; and execution depends on people, processes, systems, and disciplined leadership. My objective is to build deeper expertise in finance, investment banking, capital markets, and corporate strategy while using this broader background to understand businesses from multiple dimensions.

From Engineering to Business and Financial Decision-Making

My academic foundation began in Electronics and Communication Engineering at SRM Institute of Science and Technology. Engineering taught me to structure complex problems, identify constraints, analyze evidence, test alternatives, and develop practical solutions. Over time, my interests expanded from how systems function to the economic and managerial decisions behind them: how organizations allocate capital, evaluate investments, balance growth and risk, and translate technology into measurable business value.

That evolution led me to pursue a Master of Engineering in Engineering Management at Stevens Institute of Technology. The program helped bridge my technical background with management, analytics, strategy, and organizational decision-making and reinforced my interest in working where analytical reasoning meets business leadership.

Banking, Analytics, and Business Transformation

My experience with Equitas Small Finance Bank provided an important foundation in financial services. Exposure to SME and retail lending, market segmentation, customer acquisition, credit underwriting, portfolio quality, and risk management introduced me to a central financial principle: capital must generate returns, but growth must remain disciplined by risk. Sustainable performance requires more than increasing lending or revenue; the quality of growth, credit performance, portfolio risk, regulatory considerations, and capital efficiency all matter.

Subsequent roles expanded my perspective into analytics, enterprise systems, product development, and business transformation. Working with operational and financial information, reporting environments, process improvement, requirements analysis, and data-driven decision support taught me that the value of analytics lies not in producing more reports, but in converting information into decisions. Tools such as SQL, Tableau, Python, and SAS supported that work, while the more important capability was learning to identify the decision at hand, evaluate relevant evidence and assumptions, and communicate useful insight to stakeholders.

At ABS Tech, my responsibilities included enterprise process analysis, workflow design, reporting, requirements prioritization, testing, implementation coordination, and the development of an automated payroll platform spanning contractor billing, salaried compensation, overtime, incentives, deductions, exceptions, and compliance requirements. At ONS Tech within ONS Hospitality Group, my project-management responsibilities extended across point-of-sale, inventory, transaction capture, purchasing, reconciliation, reporting, and related financial workflows. These experiences reinforced that transformation is rarely a purely technological problem; successful execution requires business understanding, stakeholder alignment, clear requirements, risk management, testing, and accountability.

Research and Intellectual Curiosity

Research has become an important extension of my professional development. My work spans investment banking, capital markets, financial technology, enterprise systems, analytics, cloud economics, cybersecurity, and commercial management, connected by a common question: how can organizations make better decisions under complexity, uncertainty, technological change, and financial constraint?

My finance-focused research has examined investment-banking strategy and universal banking, ECM and DCM considerations, cross-border banking, market microstructure, volatility regimes, equity-factor behavior, portfolio risk, financial feasibility, return on investment, and capital allocation. Other work has explored financial-data integrity, marketing attribution and budget optimization, cloud-resource efficiency, privacy-preserving cybersecurity, and commercial project leadership. Across these topics, I have sought to move beyond established frameworks by examining assumptions, connecting financial and operational considerations, and developing evidence-based perspectives.

Why Finance and Investment Banking

My interest in investment banking is a natural extension of these experiences. The field brings together areas that have consistently attracted me: financial analysis, corporate strategy, valuation, capital allocation, industry research, transaction execution, capital markets, risk, negotiation, and high-stakes decision-making. Questions such as how much a business is worth, whether a company should acquire or divest an asset, how growth should be financed, and which strategic alternatives create the greatest long-term value require both quantitative rigor and commercial judgment.

My path is not a conventional investment-banking path, but its breadth is an asset I intend to build upon. Banking gave me exposure to credit and financial risk; analytics strengthened my quantitative reasoning; enterprise systems taught me how information and controls flow through organizations; project leadership developed my ability to coordinate complex initiatives; and research has deepened my understanding of markets and institutional strategy. Investment banking is a setting in which these capabilities can converge while I develop substantially deeper expertise in corporate finance, valuation, and transactions.

The Role of My MBA

My full-time MBA at Santa Clara University's Leavey School of Business represents the next stage of that development. I view the MBA not simply as a credential, but as an opportunity to strengthen the financial, strategic, managerial, and leadership capabilities required for the next phase of my career. It allows me to challenge ideas formed through professional experience, learn from different industry perspectives, and deepen the theoretical foundations behind business decisions. My goal is to emerge with not only additional knowledge, but better judgment: the ability to evaluate complex situations through financial, strategic, operational, technological, and human perspectives.

Technology as an Enabler of Finance

Although I am moving deeper into finance, technology will remain central to how I think about financial services. Artificial intelligence, automation, alternative data, cloud computing, and advanced analytics are changing how institutions assess risk, serve clients, allocate capital, and identify opportunities. I am particularly interested in applications where traditional financial infrastructure remains inefficient, including SME financing.

Small and medium-sized businesses contribute significantly to economic activity yet often face inefficient access to capital. Traditional underwriting can rely heavily on historical statements, collateral, standardized credit metrics, and lengthy review processes. Technology creates opportunities to supplement these approaches with broader data, dynamic risk assessment, and scalable decision systems. My long-term interest is therefore not technology for its own sake, but technology that improves financial judgment and access to capital.

Long-Term Vision and Leadership Philosophy

In the near term, I intend to build rigorous expertise in finance, corporate strategy, capital markets, transactions, and investment banking. I want to analyze businesses comprehensively: their financial performance, competitive position, industry dynamics, capital requirements, risks, strategic alternatives, and potential value. Over the longer term, I intend to combine that financial expertise with my experience in technology, analytics, banking, and project leadership to contribute to and eventually build businesses that address meaningful financial-market problems, particularly technology-enabled infrastructure that can improve how SMEs are assessed and connected with capital.

My view of leadership has evolved alongside my career. I do not believe leadership is defined primarily by title or authority. It is the ability to create clarity when problems are ambiguous, establish accountability across organizational boundaries, make informed decisions with incomplete information, communicate across different perspectives, and maintain focus on outcomes. Analytical rigor matters, but analysis alone does not produce results: execution requires communication, strategy requires alignment, transformation requires trust, innovation requires experimentation, and financial performance requires discipline.

What I Hope to Build

One principle has remained consistent throughout my transition from engineering to management, banking, analytics, project leadership, research, and business education: learning compounds. Engineering influences how I structure problems; analytics shapes how I evaluate evidence; banking informs how I think about capital and risk; project management shapes execution; research teaches me to challenge assumptions; and finance provides a framework for evaluating value. I approach my career as an ongoing process of integrating these capabilities rather than progressing toward a single fixed destination.

Ultimately, I want my career to be measured not only by the positions I hold, but by the value I create: helping organizations make better financial and strategic decisions, contributing to transactions and initiatives that create sustainable economic value, building systems that improve efficiency and transparency, leading teams through difficult objectives, and eventually developing financial solutions that expand access to capital. I see the different stages of my journey as parts of one evolving objective: to understand how capital, strategy, technology, and execution come together to create enduring business value. That objective continues to guide what I study, what I research, the opportunities I pursue, and the professional I intend to become.
